

# Artificial Intelligence Problem Set 6

Willie Yee

## Problem 1.

- Combining rule 1 with fact 4 with substitution  $\{x \rightarrow \text{Mary}, y \rightarrow \text{Henry}, z \rightarrow \text{Catherine}\}$ , infer 6: Parent(Henry, Mary).
- Combining rule 2 with fact 4 with substitution  $\{x \rightarrow \text{Mary}, y \rightarrow \text{Henry}, z \rightarrow \text{Catherine}\}$ , infer 7: Parent(Catherine, Mary).
- Combining rule 1 with fact 5 with substitution  $\{x \rightarrow \text{Edward}, y \rightarrow \text{Jane}, z \rightarrow \text{Henry}\}$ , infer 8: Parent(Jane, Edward).
- Combining rule 2 with fact 5 with substitution  $\{x \rightarrow \text{Edward}, y \rightarrow \text{Jane}, z \rightarrow \text{Henry}\}$ , infer 9: Parent(Henry, Edward).
- Combining rule 3 with facts 6 and 9 with substitution  $\{x \rightarrow \text{Henry}, y \rightarrow \text{Mary}, z \rightarrow \text{Edward}\}$ , infer 10: Sibling(Mary, Edward).

## Problem 2.

A.

$$P(X = a) = 0.1 + 0.2 + 0.05 = 0.35$$

$$P(X = b) = 0.2 + 0.05 + 0 = 0.25$$

$$P(X = c) = 0.1 + 0.2 + 0.1 = 0.4$$

$$P(X = d) = 0.1 + 0.2 + 0.1 = 0.4$$

$$P(X = e) = 0.2 + 0.05 + 0.2 = 0.45$$

$$P(X = f) = 0.05 + 0 + 0.1 = 0.15$$

B. X and Y are not independent because the probability in the top right cell (0.1) is not equal to the probability of a times c ( $0.35 \cdot 0.4 = 0.14 \neq 0.1$ )

C.  $P(X = a|Y = e) = \frac{0.2}{0.45} = 0.444$

## Problem 3.

A.

$$\frac{2}{5} \cdot 0.2 + \frac{2}{5} \cdot 0.6 + \frac{1}{5} \cdot 0.9 = 0.5$$

B. The probability that the coin is category 1 is:  $\frac{\frac{2}{5} \cdot 0.2}{0.5} = 0.16$

The probability that the coin is category 2 is:  $\frac{\frac{2}{5} \cdot 0.6}{0.5} = 0.48$

The probability that the coin is category 3 is:  $\frac{\frac{1}{5} \cdot 0.9}{0.5} = 0.36$

C. The probability that a coin randomly picked up from the bag gets heads twice in two tosses is  $\frac{2}{5} \cdot 0.2^2 + \frac{2}{5} \cdot 0.6^2 + \frac{1}{5} \cdot 0.9^2 = 0.322$

The probability that the coin is category 1 is:  $\frac{\frac{2}{5} \cdot 0.2^2}{0.322} = 0.04969$

The probability that the coin is category 2 is:  $\frac{\frac{2}{5} \cdot 0.6^2}{0.322} = 0.44720$

The probability that the coin is category 3 is:  $\frac{\frac{1}{5} \cdot 0.9^2}{0.322} = 0.50310$
